### 3. Jumper Settings

JP1: USB Bus Power Selector	Settings
<b>Jumper at "P":</b> The USB2.0 Bus Power is supplied by PCI Express slot of the motherboard (DC+5V supplied from PCB)	 (default)
<b>Jumper at "A":</b> The USB2.0 Bus Power is supplied by the AUX power connector (J6). You may need a power cable to connect the DC+5V power from the system power connector to J6 to get the AUX power supplied. This option provide more power for the USB devices over the USB2.0 cable	

### 4. Installing USB2.0 PCI Express Card

1. Turn the system power OFF before installation!
2. Use static electricity discharge precautions.  
Remove possible static discharge potential from any objects that the combo card may come in contact with before installation. This can be accomplished by touching a bare metal chassis rail after you have turned off the power.
3. Remove the chassis cover from your computer
4. Locate an unused PCI Express slot (typically white or black, and smaller than the PCI slot) and remove the corresponding slot cover from computer chassis.
5. Plug the combo card to the unused PCI Express expansion slot and attach the USB2.0 PCI Express card bracket to the computer chassis screw.
6. Some computer cases provide 2 USB ports in their front panel. If your case has this feature, you will find the leads of the USB flat cable from its front. Usually, leads are labeled; if not, check the manual of your case.

 **WARNING!** A wrong connection may damage your USB devices, USB2.0 card or your motherboard. Please install the cable carefully. After installed the cables, it strongly recommended test with an inexpensive USB device (USB mouse for example). Please don't connect the expensive USB devices unless you are sure you did the right connection.

7. Put the chassis cover back on the computer.
8. Turn ON the power of your computer and peripherals.
